

ENTITY REGISTRATION NOTICE

Peregrine Applied Sciences LLC is the approved legal name of the same Texas LLC formerly named Anchorpoint Managed Technologies LLC. The SAM.gov legal-name update is pending; the active record may temporarily display the former name. UEI: XJT8AM2R4MT8 CAGE: 225F1.

MISSION

Peregrine Applied Sciences is a small defense engineering and applied research company built to turn technically difficult sensing, communications, autonomy, and aerospace problems into testable hardware and software. We combine depot-level RF experience, military avionics and systems engineering, advanced CAD/mechanical design, and modern AI/software development to support requirements through prototype, integration, verification, and transition.

CORE ENGINEERING CAPABILITIES

- **Systems engineering:** requirements decomposition, architecture, interface definition, trade studies, verification planning, configuration and technical data.
- **RF / communications:** tactical RF, retransmission, antennas, link architecture, radar/RF payload integration, test and troubleshooting.
- **Electrical / avionics:** airborne electronics, embedded systems, power architecture, harnessing, integration and instrumentation.
- **Mechanical / CAD:** 3D modeling, detailed drawings, mechanical packaging, structural concepts, producibility and technical documentation.
- **Software / algorithms:** tracking, sensor fusion, autonomy support, AI/security research, simulation and deterministic data-processing pipelines.
- **Prototype / integration:** rapid design-build-test cycles, bench integration, subsystem validation, root-cause analysis and engineering documentation.

WHY PEREGRINE

- Cross-domain team: RF sustainment + depot operations + avionics + mechanical design + software/AI in one small engineering organization.
- Sustainment-informed design: technical decisions consider maintainability, repairability, documentation and lifecycle support - not only prototype performance.
- Full-stack ownership: ability to move from first-principles modeling into CAD, electronics, software, integration and test without excessive handoffs.
- Rapid technical iteration: small-team execution with direct access to senior technical leads and short decision loops.

REPRESENTATIVE DEVELOPMENT AREAS

Distributed sensing and tracking | RF/radar payloads | tactical communications | airborne edge processing | unmanned aircraft | resilient data links | test automation | sustainment engineering | technical data packages

COMPANY DATA

Legal name	Peregrine Applied Sciences LLC
Location	El Paso, Texas
UEI	XJT8AM2R4MT8
CAGE	225F1
Primary NAICS	541330 - Engineering Services
Secondary NAICS	541715 - Engineering R&D
Website	peregrineappliedsciences.com
Email	info@peregrineappliedsciences.com
Phone	(915) 270-3223

KEY PERSONNEL

Austin Howard - Founder / Managing Member
Former USAF F-16 avionics technician and systems engineer; currently pursuing a B.S. in Electrical Engineering at Arizona State University. Experience includes systems architecture, CAD, integration, technical documentation, and AI/security research including InjectLab.

Raul Negrao - Chief of RF Engineering
20 years of Army RF, retransmission, sustainment and depot-level experience across a broad range of tactical communications systems. Leads RF architecture, integration, test, troubleshooting and sustainment-informed design.

Jose Escobedo - Co-Founder / Mechanical Design Lead
30 years of CAD modeling, drafting and drawing-package experience. Leads mechanical design, detailed technical drawings, packaging, producibility support and configuration-controlled design documentation.

MISSION ALIGNMENT

Relevant to organizations responsible for C5ISR readiness, communications-electronics engineering, depot sustainment, radar/RF systems, UAS integration, avionics, rapid prototyping, technical data development and field support.

Engagement objective: partner with government problem owners and prime/depot organizations where a small, multidisciplinary engineering team can reduce technical risk, accelerate prototyping, or close documentation / integration gaps.
